Osaka (Japan), July 04, 2016 – Maruho Co., Ltd (“Maruho”, Head Office: Osaka, Japan, President and CEO: Koichi Takagi) announces that it has received manufacturing and marketing approval in Japan from the Japanese Ministry of Health, Labor and Welfare (MHLW), for infantile hemangioma treatment “Hemangiol® Syrup for Pediatric 0.375%” ("Hemangiol" INN: propranolol hydrochloride).

Hemangiol is an oral solution formulation of a treatment using the active ingredient propranolol hydrochloride developed by Laboratoires Pierre Fabre Dermatologie (“PFD”, France, Boulogne, CEO: Jean-Jacques VOISARD). Hemangiol is currently approved in 36 countries.

In December 2012, Maruho entered into an exclusive license agreement with PFD to develop and market the product in Japan for the treatment of infantile hemangioma. In November 2013 the MLHW designated the product as an orphan drug.

Infantile hemangiomas are benign tumors that develop most often in infancy. Generally, infantile hemangioma develops from 1 to 4 weeks after birth, grow to maximum size in about 1 year, then naturally shrink and regress by 5-7 years old. Almost all infantile hemangiomas are followed without treatment, but in some cases treatment is required. If the infantile hemangioma may cause a life threatening problem, may interfere with body functions or cause permanent cosmetic damage, treatment should be considered. Current treatments in Japan are considered to be unsatisfactory in regard to safety and efficacy, and a new treatment is desired. However, a treatment indicated for infantile hemangioma has not been approved until now.

With this application, Maruho hopes to provide a new treatment option to improve the lives of patients and their families suffering from infantile hemangioma.
Product Profile: Hemangiol®

<table>
<thead>
<tr>
<th>INN</th>
<th>Propranolol hydrochloride</th>
</tr>

About infantile Hemangioma
Infantile hemangioma is a disease where often a small bruise swells to form a vivid, crimson, strawberry-like lesion. Hemangiomas are benign tumors that develop most often in infancy. The incidence in Japan is estimated to be about 1% of the population of infants. In 90% of cases, infantile hemangioma develop from 1 to 4 weeks after birth, grow to maximum size in about 1 year, then naturally shrink and regress by 5-7 years old.¹
